

AR Match Pro

User Guide & Reference Manual

Browser-based AR Cash Application Platform for SAP & NetSuite mid-market finance teams. Live the same day — not a six-month project.

Version 2.1

armatchpro.com

What's new in 2.1 — standardized Invoice Import Template with hard validation · Approve All / Unselect All toggle in Review · Review-scoped Clear all · aging-resolved Cash-on-Account notes ("COA for SO ...") · stale-invoice recovery via the delivery bridge · multi-account matching under one parent customer.

1 · Getting Started

Logging In

Navigate to your AR Match Pro URL and enter your credentials. New users can register from the login screen. If you have a license key, enter it during registration to activate your plan.

Loading Data

Use the setup checklist (or the top-right buttons) to load data in this order:

Step	File	Required
1. Upload Invoice Report	Open invoices — ARMP Invoice Import Template or a native SAP FBL5N export (see Section 2)	Yes
2. Upload Bank File	Bank statement (BAI2, CSV, Excel, PDF, or a statement screenshot)	Yes
3. Upload Remittance Details	Customer remittance advice (file or screenshot)	Optional
4. Upload Delivery Report	Delivery / tracking enrichment — enables shipment-reference matching	Optional

All invoice imports are validated against the ARMP Invoice Import Template. Files missing a required column (Account, Invoice, or Amount) are rejected before anything changes, with a message naming exactly which columns are missing and a one-click template download. SAP FBL5N exports pass automatically — no reshaping needed.

After importing, click **Run Auto Match** to run a full matching cycle — exact matches, multi-invoice PO groups, shipment-reference bridges, and short pays are detected automatically. The workspace starts fresh each Monday so you always begin the week clean. Multiple files can be dropped in a single selection; each import completes in order.

Navigation

Section	Purpose
Cash Application	Main workspace: match, review, reconcile, export
Posting Export	Final review and ERP posting file download
Reports	Auto-Match Rate, DSO, exception breakdown, export
CFO Summary	Executive dashboard: period metrics, DSO, ROI
Settings	Matching rules, name normalization, ERP export profile, plans
Help & Support	User guide and built-in support assistant

2 · The ARMP Invoice Import Template

Every AR Match Pro workspace imports open invoices through one standard template, so matching behaves identically for every customer. Download it from **Import Invoice Data** → **Download ARMP Invoice Template** (also offered whenever a file fails validation). The workbook includes an Instructions sheet and two sample rows — delete the samples before importing real data.

Required Columns

Column	Contents
Account	Customer account number in your ERP (e.g. SAP Kunnr)
Invoice	Open invoice / billing document number
Amount	Open amount in document currency (negative = credit)

Recommended Columns

Column	Why it matters
PO Number	Customer purchase order — drives remittance PO matching
Sales Order	Used for Cash-on-Account notes when a PO has no exact-amount invoice
Document Type	e.g. RV (invoice), DZ (payment) — non-invoice rows are excluded from matching automatically
Document Date / Net Due Date	Aging buckets and oldest-first (FIFO) tie-breaking
Document Number	Accounting document — audit trail on every posting
Customer Name	Display name; ARMP falls back to the import filename when absent
Currency / Text	Document currency; free-text references are parsed for embedded invoice/PO/SO numbers

Optional Shipment Columns

Column	Why it matters
Delivery #	SAP delivery document tied to the invoice — enables delivery-number matching
Bill of Lading	Carrier tracking (UPS 1Z..., DHL numeric). Date/carrier prefixes like "3/12/2026 DHL 5213011672" are cleaned automatically
Logistics Memo - Internal Header	Internal shipment references (e.g. SS... numbers) that customers quote on remittances instead of invoice numbers

SAP FBL5N exports are accepted natively. "Billing Document = Invoice", "Payment reference = Purchase Order = PO", and "Reference Key 3" (Sales Order) map automatically to the template fields — the sales order is read from Reference Key 3 when no explicit Sales Order column exists.

3 · Cash Application

The core workspace has four tabs: **To Be Matched**, **Review**, **Exceptions**, and **Reconcile**.

Payment Queue & Open Items

The queue lists all imported payments (customer, amount, method, bank tag, status). Click any payment to load it. The open-items grid shows the customer's open invoices, sorted by relevance — the engine's suggested match is highlighted and shown in a banner. When you select a payment, the view expands to a full-width dense grid; use Minimize to focus on invoices and Expand to bring back the payment details.

Auto-Matching Engine

Click **Run Auto Match** to match across all payments. The engine tries these methods in order:

Priority	Method	Description
1	Invoice #	Payment or remittance references an exact invoice number (multi-invoice shorthand like "5105205708, 09" is expanded automatically)
2	Delivery bridge	Shipment reference or carrier tracking → delivery report → sales order → invoice, disambiguated by exact amount
3	PO Group / Subset	Sum (or subset) of open invoices on the same PO equals the payment
4	Sales Order	Match by Sales Order reference
5	Amount	Same account + matching dollar amount
6	Exception	No safe match found — flagged for manual review

Matching is **conservative by design**: an invoice is only applied when the remittance amount ties exactly (or a unique combination ties). ARMP never partial-pays an unrelated invoice just because it sits under the same PO or sales order — a non-tying line routes to Cash on Account instead. Payments from one parent customer are matched across **all** of its accounts in the aging.

Remittance Details

When a payment has associated remittance advice, its lines (invoice #, PO, SO, tracking, amount, and remarks) appear directly in the payment view. Remittance screenshots are parsed with OCR; lines read from an image are always held for review before cash posts.

Manual Allocation, Approve & Review Controls

Select a payment, then check invoice rows. The running total shows applied vs remaining. Click **Approve** when the allocation ties to zero — approved records move to Review. Payments with no matching invoice can be posted as Cash on Account.

Approve All ↔ Unselect All. The Review tab's Approve All button is a toggle: one click approves every allocation in Review; when everything is approved the button reads **Unselect All**, and clicking again returns every allocation to its unapproved state — nothing is removed and no exceptions are created. Exported (locked) rows are never touched.

Clear all (Review). The Clear all button in the Review tab clears **only** the Review section: matched allocations are removed and their invoices reopen, while imported invoices, payments, and exceptions stay exactly as they were.

Run Auto Match again to regenerate matches. Full workspace resets remain available from Settings.

4 · Confidence Scoring

Every match shows a confidence score from 0–100%, built entirely from objective signals — never a black-box guess. Click any score badge to see the full breakdown.

Confidence Bands

Band	Meaning
90–100%	High — strong, definitive match. Safe to auto-apply.
70–89%	Good — solid match, quick review recommended.
50–69%	Moderate — verify before approving.
Below 50%	Low — manual review required before posting.

How the Score Is Built (Auditable)

The score is the sum of the individual matching signals. Every point is itemized so the total is fully explainable to a controller or auditor:

Signal	Weight
Invoice # exact match	+50
Sales Order # match	+30
PO # match	+25
Tracking / Delivery #	+35
Exact amount	+20
Customer account	+15

Exact amount uniquely identifies the invoice on the correct account up to 90%+. A payment that exactly matches an invoice amount on the correct customer account scores 90%+ even when the remittance reference doesn't carry the invoice number — because that combination is statistically definitive. Lines read from a screenshot (OCR) are capped below auto-post confidence and always require a human look. The breakdown always adds up to the displayed score.

5 · Exceptions, Short Pays & Cash on Account

Payments that can't be matched automatically appear in the **Needs Attention** tab. Open one to see the customer's open items and resolve it.

Situation	Resolution
Short pay	Apply the partial amount and leave the balance open, or write off the difference (within your tolerance).
Overpay	Apply to the invoice and post the surplus as cash on account.
No matching invoice	Post as Cash on Account against the customer to apply later. ARMP pre-fills the account, amount, and note.
Invoice not yet posted (e.g. RMA)	A remittance line whose shipment exists but has no open invoice posts as Cash on Account with the shipment reference in the note.
Possible duplicate	Flagged only when another payment shares the same reference and amount. Verify before posting.
Bank fee	Record the fee so the allocation ties out cleanly for ERP posting.

Cash-on-Account Notes — "COA for SO ..."

When a remittance line pays a PO that has no exact-amount open invoice, ARMP resolves the PO against the aging itself (Sales Order column or SAP Reference Key 3) and suggests the note in your allocation convention — e.g. **"COA for SO 2104396495"** — posted to the account that holds that PO's open items in the aging. Bank identifiers (ACH originator / receiver IDs, wire references) are never suggested as invoice numbers.

Stale Invoice Recovery

If a remittance quotes an invoice number that is not in the aging (reversed and rebilled, or the customer's copy is outdated), the delivery bridge resolves the line's tracking number to its shipment, then to the sales order — and applies the reissued open invoice when the amount ties exactly. The bridge chain is shown on the match for audit.

A short pay is only flagged when there is no exact-match invoice available. If the payment exactly matches an invoice — even one already applied — it is not treated as a short pay of a different invoice.

Reconcile

The Reconcile tab shows approved allocations and whether each ties out (variance minus write-offs and bank fees equals zero). Resolve any unreconciled items before exporting.

6 · Posting Export

Once allocations are approved and reconciled, export a posting file for your ERP. Choose your format in **Settings** → **ERP Export Profile**.

Format	Best For
SAP S/4HANA	SAP S/4HANA cash application posting
SAP ECC	Legacy SAP ECC environments
NetSuite	NetSuite cash receipt import
Generic CSV	Universal ERP import; most accounting systems
Excel	Manual review, pivot tables, Excel-based workflows

Always review the Reconcile tab before exporting. Enter any write-offs and bank fees so the export balances correctly in your ERP. Exported items are locked to preserve the audit trail — locked rows are excluded from Approve All / Unselect All and from Clear all in Review until you Unlock & Edit.

7 · Settings

Matching Engine

Setting	Description
Match Priority	Reorder rules: Invoice #, PO, SO, Amount
Tolerance (\$)	Dollar amount within which a match is exact (default \$1.00)
Short-pay threshold	Variances below this are flagged as short pays
Customer Name Normalization	Map bank-truncated names to canonical names (e.g. FORD MOTOR COMPA → FORD MOTOR COMPANY). Each organization starts with a clean list and adds its own aliases.
ERP Export Profile	SAP S/4HANA, SAP ECC, NetSuite, Generic CSV, or Excel

Key Concepts

Term	Definition
Auto-Match Rate	% of payments matched automatically without human input. Above 80% is excellent.
DSO	Days Sales Outstanding. Lower is better.
Unapplied Cash	Payments received but not yet matched to an invoice.
Short Pay	Payment less than the invoice amount — variance requires resolution.
Exception	Payment that could not be auto-matched — needs manual review.
Delivery Bridge	Shipment reference / tracking → delivery report → sales order → invoice resolution, disambiguated by exact amount.
ARMP Import Template	The standard invoice import format. Required: Account, Invoice, Amount. FBL5N exports qualify automatically.

Help & Support

The built-in support assistant answers common "how do I" questions instantly — importing, the import template, auto-match, confidence, exceptions, short pays, export, reconcile, settings, and more. For anything beyond the basics, email info@armatchpro.com.
