1. Overview & Key Concepts

AR Match Pro is an **enterprise-grade Accounts Receivable cash application platform** purpose-built for SAP-shop AR teams handling complex multi-channel payments (ERS, VMI, lockbox, ACH, wire). It automates matching incoming payments to open invoices using **deterministic SAP data lineage** — every match traces to a clear, auditable reason. No black-box AI predictions.

What makes ARMP different

Capability	What it does	Why it matters
SAP Delivery Bridge	Uses your delivery report (PO → SO → invoice lineage) for exact-amount matching	Audit-friendly. Every match has a concrete data path.
Conservative matching	Routes ambiguous payments to Cash on Account instead of partial-paying	No false matches. No stuck cash from misallocation.
Per-line COA postings	Each unmatched ERS/VMI line becomes its own posting entry	Maps 1:1 to your AR team's manual allocation spreadsheet
Customer learning	Persists per-customer matching patterns across sessions	ARMP recognizes Applied Materials, Celestica, etc. on subsequent encounters
AI Remittance Parser	Extracts structured remittance from unstructured emails/PDFs	Handles the 20% of cases that defeat column-based parsers

Key Metrics

Term	Definition
------	------------

Auto-Match Rate (STP)	% of payments matched automatically. $\geq 80\%$ is excellent.
DSO — Days Sales Outstanding	$(\text{Open Balance} \div \text{Matched Revenue}) \times 30$. Lower is better.
Match Confidence	0-100% score on every match. 98% = VMI explicit, 96% = ERS residual, 92% = generic COA.
Unapplied Cash	Payments received but not yet matched.
Short Pay / Overpay	Payment < or > invoice amount. Requires resolution.
Exception	Any payment that couldn't auto-match and needs manual review.
Posting Export	Final file for ERP import (SAP F-28, NetSuite, D365, generic CSV).

Workflow

Import Invoices → Import Remittance → Run Auto-Match → Review Exceptions → Approve → Export to ERP

All steps are reversible until the posting export is downloaded.

2. Getting Started

Logging In

Navigate to your AR Match Pro URL. New users register from the login screen.

Free Trial

Click **Start 7-Day Free Trial** for full Pro access — no credit card required. Trial data persists in your browser between sessions.

Loading Sample Data

- **Invoices tab** → “Load sample” → 17 sample invoices including the Pinnacle Systems multi-invoice PO case
- **Remittance tab** → “Load JPM” or “Load BOA” → bank-tagged sample payments

Navigation

Section	Purpose
Today's Work	Worklist dashboard with urgent exceptions
Cash Application	Main workspace: match, review, reconcile, export
Invoices	View, edit, import, manage open invoices
Remittance	View, edit, import remittance details
CFO Summary	Executive view with NEW Trends Dashboard
Posting Export	Final review & ERP file download
Reports	Operational metrics
Settings	Account, matching rules, plan management

3. Dashboard & KPI Cards

The KPI strip displays real-time metrics. Each card is clickable and navigates to the relevant section.

Card	Color	Click →
Cash Matched	Green	Reconcile tab
Match Rate	Blue	Reports
Unapplied Cash	Gold	To Be Matched
Exceptions	Red	All Exceptions
Short Pays	Orange	Exceptions, filtered
Invoices / Payments	Neutral	Respective panels

4. Importing Data

ARMP accepts data in CSV, Excel, BAI2, CAMT.053, OFX, MT940. Column names auto-detect — no template required.

Auto-Detected Column Names

Standard SAP and NetSuite exports recognized:

Field	Recognized variants
Customer Name	Name, Name1, Debtor Name, Sold-to Name
Account #	KUNNR, Customer Account, Debtor Number
Invoice #	BELNR, Document Number, Reference
PO Number	EBELN, Purchase Order, Customer PO, Assignment, ZUONR
Sales Order	VBELN, SO, Sales Document
Amount	WRBTR, DMBTR, Net Due, Open Amount
Invoice Date	BLDAT, BUDAT, Document Date
Due Date	ZFBDT, Net Due Date, Maturity Date

Delivery Report — Persistent Index (NEW in v2.0)

Upload your SAP delivery report once. ARMP **persists it locally** (IndexedDB) so subsequent sessions load it automatically. The “Delivery index: 13,162 records · last updated today” indicator confirms the persisted state.

Click “Clear” in the indicator to wipe and re-upload.

5. The SAP Delivery Bridge — Deterministic Matching

This is ARMP’s primary differentiator. When you upload an SAP delivery report alongside your AR aging file, ARMP uses the delivery → SO → invoice lineage to deterministically match payments — no ML predictions, no opaque scoring.

How it works

For each ERS line in a customer’s payment:

1. **Look up the delivery row** by PO + amount (built into an O(1) index at import time)
2. **Resolve the Sales Order** from the delivery row
3. **Find the matching open invoice** in the SO's candidates (exact-amount only)
4. **Apply the payment** with full data lineage stored in the audit trail

Conservative philosophy

If the amount doesn't tie exactly to a specific aging invoice, ARMP **does NOT partial-pay** — it routes the line to Cash on Account with a detailed reference (COA for SO 2104422821 , VC ; 05/05/2026).

Why: Partial-paying an unrelated invoice creates “stuck cash” that auditors flag and that requires manual reversal. ARMP's approach: when in doubt, COA — never guess.

ERS / VMI consolidated payments

ARMP natively handles SAP-shop AR scenarios:

- **ERS (Evaluated Receipt Settlement)** — customer self-billing with PO references
- **VMI (Vendor-Managed Inventory)** — VC ; DATE references with no specific invoice
- **Consolidated wires** — 40-50 invoices in one bank payment

Each unmatched ERS line and each VMI line becomes its own Cash on Account exception with the specific reference preserved.

6. Cash Application Workflow

Cash Application has four tabs: **To Be Matched**, **Review**, **Needs Attention** (formerly Exceptions), and **Reconcile**.

Auto-Match priority order

Priority	Match Type	Description
1	Direct Invoice #	Payment references exact invoice number
2	Document #	Posting document number match
3	PO Group Match	Sum of invoices on the same PO = payment amount
4	Sales Order Match	Match by SO reference
5a	Delivery Bridge (NEW)	Use SAP delivery report for ERS/VMI routing
5b	Subset Sum	A subset of invoices on the same PO equals the payment
6	Exception	No match — flagged for manual review

Match Confidence Pills (NEW in v2.0)

Every match shows a color-coded confidence pill: - **Green ≥90%** — Auto-approve safely - **Amber 70-89%** — Quick verify recommended - **Red <70%** — Deeper review needed

The pill is visible on both the **Review tab** rows and the **Needs Attention** cards. Click any row/card to see the “Matched by” breakdown (Invoice # ✓, Delivery Bridge ✓, Sales Order ✓, etc.).

7. Exception Management (Needs Attention)

Exception Types

Type	Resolution
Short Pay	Write off difference, chase remainder
Overpay	Return excess or apply as credit
Unmatched	Contact customer to identify payment
Missing PO	Request PO from customer
Duplicate	Verify with bank; reject if confirmed
Cash on Account	Post as unapplied credit
Bank Fee	Book to bank fee GL account

Per-Line Cash on Account (NEW in v2.0)

For a customer payment like Applied Materials' \$247K (which historically required 15 separate posting entries: 3 ERS COA lines for PO 4521689046 + 12 VMI VC date lines), ARMP creates **one EXC per posting line**. Each carries the specific reference note your AR team would type into SAP:

```
💰 Cash on Account · APPLIED MATERIALS · $21,600.00 · VC;;05/05/2026 [98% pill]
💰 Cash on Account · APPLIED MATERIALS · $16,500.00 · COA for SO 2104422821 [96% pill]
💰 Cash on Account · APPLIED MATERIALS · $5,400.00 · VC;;05/05/2026 [98% pill]
... (15 total for this payment)
```

Bulk Approve (NEW in v2.0)

When 2+ Cash on Account EXCs share the same payment reference, a cyan banner appears at the top of the Needs Attention tab:

```
< 15 Cash on Account postings · APPLIED MATERIALS · $83,654.00
  Same payment (Ref: 2226041757) · Account 40016800
                                [> Post All as Cash on Account]
```

One click resolves all 15 EXCs with their specific notes preserved.

8. AI Remittance Parser (NEW in v2.0)

For unstructured remittance — emails, PDFs, vendor portal exports that don't have a clean column structure — the **AI Parse** button extracts structured remittance lines using Claude.

How to use

1. Click **AI Parse** next to "+ Remittance Details" on the Cash Application page
2. First time only: paste your Anthropic API key (stored in your browser's localStorage — never sent to ARMP servers)
3. Paste unstructured text:

```
Hi, our payment of $50,000 is applied as:
- Invoice 5105123456: $12,500
- Invoice 5105123457: $20,000
- PO 4521000123: $17,750 (less $250 damage deduction)
```

OR drag/drop a PDF or image

4. Click **Parse with AI** → ARMP returns structured remittance lines
5. Review the parsed table → click **Add to Remittance** → entries flow into your remittance details for matching

Tier policy

Tier	AI Parsing
Starter (\$799/mo)	50 free parses per month, then \$0.05/parse
Pro (\$1,399/mo)	Unlimited parses included
Team (\$2,699/mo)	Unlimited parses included

When to use AI parsing

✓ Customer emails with prose remittance instructions ✓ Scanned PDFs from vendor portals ✓ Image attachments of remittance advice ✓ Multi-page PDFs with embedded tables

When NOT to use AI parsing: ✗ Clean CSV/Excel exports — use the regular Remittance Details import (faster, free) ✗ Standard SAP F-28 outputs — column-based parser handles these

9. Customer Learning & Profiles (NEW in v2.0)

After every Auto-Match, ARMP records what it observed per customer and persists it locally. On subsequent payments from the same customer, ARMP **recognizes them** and surfaces their learned profile.

What ARMP learns

```
{
  "name": "APPLIED MATERIALS, INC.",
  "accounts": ["40016800", "40017108"],
  "observedPOFormats": ["#####", "VC;##/##/####"],
  "avgPaymentAmount": 247274,
  "maxPaymentAmount": 686725,
  "paymentTypes": { "hasERS": true, "hasVMI": true, "hasDelivery": true },
  "encounterCount": 24
}
```

Where you see it

- **Review tab** — Each customer row shows  Profile loaded · 24x badge when ARMP recognizes them from prior sessions
- **CFO Summary** — Customer Profiles grid showing top customers by encounter count, with badges for payment type mix
- **Settings** — Manage / clear individual profiles if needed

Why it matters

This is the explainable alternative to ML “learning”: - **Transparent** — every observation is a readable JSON field, not opaque neural network weights - **Cold-start friendly** — works from encounter #1, gets richer over time - **Auditable** — when a controller asks “Why did ARMP confidently match this customer?” the profile is right there

10. Historical Trends Dashboard (NEW in v2.0)

The **CFO Summary** page now includes a “📉 Historical Trends” section showing operational performance over time. Reads from a persistent match-history store (auto-logged after every Auto-Match run).

Three charts

1. **Match Rate Trend** — Line chart of the last 10/30/90 runs. Dots color-coded by tier. Stats line shows latest %, average %, trend vs previous run.
2. **Exception Mix** — Donut breaking down the latest run: Exact / Subset Exact / Partial / Cash on Account / Short Pay. Center shows total count.
3. **Customer Profiles Grid** — Top 8 customers by encounter count, each card showing accounts, average payment amount, and badges for payment types (ERS/VMI/Delivery).

Range selector

Top-right dropdown: switch between 10, 30, or 90 most-recent runs.

Clear history

“Clear” button wipes all persisted match runs (the customer profiles stay).

11. Review Tab

Shows all matched records awaiting export. Sources: auto-matching results + manually approved allocations.

Match Reason Pills (NEW in v2.0)

Below each row’s customer header, ARMP displays the specific signals that produced the match:

✓ Invoice # ✓ Delivery Bridge (SAP) ✓ Sales Order ✓ PO # ✓ Amount Tie-Out ✓ Customer

Hover to see the per-signal confidence weighting. This makes every match defensible in an audit.

Actions

- **Approve** — locks the match for export
- **Revert** — sends back to Needs Attention
- **Remove** — deletes the match row (with confirmation)
- **Export Posting File** — downloads ERP-ready file (next section)

12. Reconcile Tab

Line-by-line view of matched payments vs invoices with editable **Write-off** and **Bank Fee** columns. Available on Pro and Team.

Column	Description
Customer	From matched invoice
Invoice #	Invoice number
PO #	Purchase order (if available)
Payment / Applied	Original vs applied amounts
Write-off	Editable — close small variances

Bank Fee	Editable — bank-deducted amounts
Variance	Net of (Applied — Original) — Write-off — Bank Fee. “Ties” = zero.
Status	Reconciled / Open

Enter write-offs within your tolerance policy to clear variances before export.

13. Invoices & Remittance Panels

Spreadsheet-like views with inline editing, multi-column sorting/filtering, and export. Click any cell to edit. Type in the filter row below headers to filter that column in real-time.

14. Posting Export

Generate ERP-ready files in the format your team uses.

Format	Best For
SAP F-28	SAP cash application posting (KUNNR, BUDAT, BELNR, EBELN, VBELN, WRBTR, WMWST)
NetSuite	NetSuite Receive Payment import
D365	Dynamics 365 cash app
Sage X3	Sage X3 posting
QuickBooks	QuickBooks IIF
Generic CSV	Any ERP that accepts delimited imports
Excel	Manual review with UTF-8 BOM encoding

Each **Cash on Account** line exports as its own row with the specific note (`VC;;05/05/2026` , `COA for SO 2104422821`) preserved — making it ready to post in SAP without any further editing.

15. Reports

Operational metrics for AR managers (Pro/Team).

Metric	Description
Cash Matched	Total \$ matched this session
Auto-Match Rate	STP rate
Unapplied Cash	Pending decisions \$
Short Pays	Count + \$ underpayments
DSO	$(\text{Open Balance} \div \text{Matched Revenue}) \times 30$
Exception Aging	Open exceptions count
Top Issue Type	Most common exception

16. CFO Summary

Executive view across monthly / quarterly / YTD periods. Includes the NEW Historical Trends section (see Section 10).

KPI alert thresholds

KPI	Default Alert
Auto-Match Rate	< 80%
DSO	> 45 days
Exception Rate	> 10%

Configure in Settings → CFO Settings.

17. Settings

Account

Name, email, role (Specialist / Manager / Controller / CFO / Admin), theme (light/dark).

Matching Engine

Drag rules to reorder, set tolerance (\$), enable/disable Invoice/PO/SO/Bridge passes.

CFO Settings

Target STP rate, AR labor rate (for ROI), subscription cost, fiscal year start, DSO/exception alert thresholds.

Anthropic API Key (NEW in v2.0)

For AI Remittance Parser. Stored locally in your browser only. Never sent to ARMP servers. Get a key at console.anthropic.com.

Change Plan

Upgrade activates immediately. Downgrade at end of billing period.

18. Keyboard Shortcuts & Power-User Tips

Keyboard Shortcuts (NEW in v2.0)

Active on the Needs Attention tab:

Key	Action
J or ↓	Next exception
K or ↑	Previous exception
A	Approve suggested action
X	Reject exception

E	Open / edit (Apply modal)
/	Focus filter
?	Show help
Esc	Close modal / blur input

Selected exception card highlighted with a purple outline.

Power-User Tips

- Bulk approve a payment’s COA lines.** When a single payment generates many Cash on Account exceptions (Applied Materials’ 15-line VMI+ERS payments), use the cyan bulk-approve banner.
- Reconcile before export.** Always check the Reconcile tab for “Ties” status before downloading the posting file.
- Use the persistent delivery index.** Upload your delivery report once per refresh cycle (monthly or weekly). ARMP remembers it for subsequent sessions.
- Bank-specific workflows.** Filter by bank account before matching when different team members handle JPM vs BOA payments.
- Customer profiles.** Let ARMP build them. They populate automatically. Check the CFO Summary’s Customer Profiles grid to see what’s been learned.

19. Troubleshooting & Support

Issue	Cause	Solution
Matching finds no results	Account # mismatch between invoices & remittance	Verify accounts match exactly. Edit inline in Invoices panel.
Delivery index empty after session	Cleared accidentally	Re-upload delivery report. It’ll persist again.
AI parser fails	API key invalid or not set	Settings → Anthropic API Key. Verify with a test parse.
Exception won’t resolve	Invoice already matched or account not found	Check Invoices panel for status.
CFO trends empty	No matching runs yet	Run Auto-Match at least once. Trends populate after.
Keyboard shortcuts not working	You’re in an input field	Press Esc to blur input, then try again.

Getting Help
